

Bllage website requirements list:

1. 10 different HTML element types: used all over the place in the html files
2. 10 different HTML attribute names: used extensively for CSS and JS functionalities.
3. 10 css rules: Way more rules than that :)
4. javascript event listener: used to rotate products in the storefront randomly when mouse hovers over them
5. Javascript framework: Used JQuery for a function related with a sidebar implementation in the program.
6. CSS framework: I did not use a CSS framework, but I think it wouldn't have helped my projects anyways as I was going for an extremely personalized and quirky look.
7. Responsive design: I did not use media queries but I designed the site using flexbox so it looks great on every screen size (I will demonstrate this in class).
8. ajax to interact with an API: My site has a dad joke generator that gets a joke from a dad joke API every time the site is refreshed.
9. CSS FlexBox: Extensively used through the page to make website look good on every screen size
10. Javascript Class: Product Class describes products in the webfront and a function automatically populates the webfront to display these products.
11. Aria Roles (INCOMPLETE): I used buttons for the products.
